

Chordbox

A \LaTeX package for drawing string instrument chord diagrams

Steven Franzen

1 Package introduction

This package is the result of a search similar to the one undertaken by Clemens Niederberger for his `leadsheets`¹ package: over the years I have collected many textual guitar tabs and chord sheets that I finally wanted to put together and typeset properly using \LaTeX , including guitar chord diagrams. The first part of my requirements is now more than fulfilled by `leadsheets`, which provides all the tools for putting together chords and lyrics. For the second part I found that there were only two relevant existing packages: `guitarchordschemes`² and `gchords`.³ Neither of these achieved exactly what I wanted, so this package is my own attempt at providing that tool. It is a short collection of TikZ code snippets, wrapped in two \LaTeX commands that are easy to use, with several options available to customise their output.

1.1 Loading the package

`chordbox` currently does not support \LaTeX options, so it is loaded simply by putting `\usepackage{chordbox}` in your document's preamble.

1.2 License

This file is part of `chordbox`. `Chordbox` may be distributed and/or modified under the conditions of the \LaTeX Project Public License, either version 1.3 of this license or (at your option) any later version. The latest version of this license is in <http://www.latex-project.org/lppl.txt> and version 1.3 or later is part of all distributions of \LaTeX version 2005/12/01 or later.

`Chordbox` has the LPPL maintenance status ‘maintained’. The Current Maintainer of `chordbox` is Steven Franzen.

2 Usage

The package provides two similar commands, `\chordbox` and `\bchordbox`. The latter extends the former to draw barred chords.

2.1 The `\chordbox` command

Syntax: `\chordbox[⟨base fret⟩]{⟨chord name⟩}{⟨fret positions⟩}`

The simplest form of the command requires you to specify only the `⟨chord name⟩` and `⟨fret positions⟩`. The former can contain any text and math symbols (see below), the latter should be a comma-separated list of elements, one for each string, which may take the following values:

- `⟨fret number⟩[:⟨fingering text⟩]`

A (positive) `⟨fret number⟩` marks the current string as fretted at that position. It may

¹Niederberger, *leadsheets*.

²Niederberger, *guitarchordschemes*.

³Peeters, *gchords*.

optionally be followed by a colon and a *<fingering text>* that can be displayed on the fret symbol or below the chord box.

- *o* (zero)
Marks the current string as open (unfretted).
- *Anything else*
An empty element or one starting with anything other than a number marks the current string as muted (not played).

It draws a grid resembling vertical strings crossing horizontal frets, with a black bar at the top figuring as the instrument's nut. The number of strings drawn is determined by the number of *<fret positions>* passed to the command, so generating chord diagrams for different instruments is no problem:

The number of frets drawn is initially 4, but this can be changed through the configuration key `/chordbox/numfrets`.

As mentioned, you can optionally provide fingering information for a chord, which is particularly useful for writing chord charts and other training materials. Because text on the fret symbol has to be scaled to fit inside it and the default scale is small, `chordbox` is initially configured to put this text below the strings, where it can be rendered at a larger size. However, the other option may be more appealing for larger diagrams, so both options can be used, see `/chordbox/text` below and `/chordbox/text` on node. They are illustrated below, where the letter T is used for the thumb and the digits for the other fingers, starting at 1 for the index finger. The larger chord box on the right has been given a scale of 2.5 times the default.

By default, the *<chord name>* is processed by a command that typesets it in math mode and roman type (see `/chordbox/name`). This allows the use of math symbols like `\flat` and `\sharp` as well as the `^` (superscript) operator to typeset decorated chord names:

`\chordbox{B\flat m}{x,x,x,3,2,1}` `\chordbox{F\sharp^{maj7}}{2,x,3,3,2,x}`

For best results, make sure to select the same typeface for both text and math typesetting. Of course, if you are also using the `leadsheets` package, you could opt to use its `\writechord` command for typesetting chord names, see also subsection 3.2.

The $\langle base\ fret \rangle$ is the number that, although formally an optional argument, must be provided for chords extending past the number of frets in the chord box. It is used to position the box and fretted notes relative to this fret, for example `\chordbox[6]{D\sharp m^{7\flat 5}}{x,6,7,6,7,x}`:

As can be seen, the nut is not drawn in these cases.

Finally, `chordbox` can also display the pitch of each note in a chord, although the default is not to. The pitches do not need to be specified manually, but are determined from the fret positions given to the command and the configured tuning (`/chordbox/tuning`). Just like fingering information, you may choose to display it inside the symbols or underneath the chord box, or combine both types of information:

Command	<code>\chordbox{D}{x,x,0,2:1,3:3,2:2}</code>		
Scale	default	2.5 × larger	2.5 × larger
text on node	none	pitch	fingering
text below	pitch	none	pitch

Result			
			D A D F#

Pitch names may include accidentals, so underneath the chord box they are displayed at `\scriptsize` to avoid overlapping at the default picture scale.

2.2 The `\bchordbox` command

Syntax: `\bchordbox[$\langle base\ fret \rangle$]{ $\langle chord\ name \rangle$ }{ $\langle fret\ positions \rangle$ }{ $\langle barre\ frets \rangle$ }`

As mentioned, this command is for drawing barre chords, for which it requires an additional comma-separated list of fret numbers. A thick line is drawn over the string symbols at these frets. The other arguments are identical to those of `\chordbox`, see for example `\bchordbox{Bm^7}{x,2,4,2,3,2}{2}` and `\bchordbox[3]{C}{x,3,5,5,5,3}{3,5}`:

3 Settings

Because `chordbox` relies on `PGF/TikZ` for drawing, it makes sense to use the powerful `PGF` key management system that comes with it. Therefore this package stores its code and style settings as keys, some of which may be modified to customise the output. This can be done in the preamble or in any part of the document by means of `\tikzset` and the more generic `\pgfkeys` command. Some examples of usage will be given below, but for more reading about `PGF` keys and their handling please refer to Section 82 of the `PGF` manual⁴ where everything is documented in full detail. In any case, modifying a key stores its value for the \LaTeX group where the command is issued and its child groups, which can override it again, but it does not propagate up to parent groups.

3.1 TikZ keys

The items described in this section are called *styles* in `TikZ` terminology and contain (lists of) keys and values that can be applied to various drawing commands. Most importantly, the `chordbox` style applies to the whole `{tikzpicture}` environment of every chord box produced. The default setting is to scale all coordinates by a quarter, because the drawing is done in `PGF`'s “natural” units that, though convenient to use, result in an impractically large picture. Note that this scaling only influences the `TikZ` coordinates; in particular, fonts are not affected by default⁵.

Because these keys are all stored in the `/tikz` path, it is most convenient to change them using the `\tikzset` command, for example `\tikzset{chordbox/.style={scale=0.4, thick}}`.

`/tikz/chordbox` (style, initially `{scale=0.25}`)

This style is applied to every `{tikzpicture}` environment produced by this package.

`/tikz/fret node text` (style, initially `{font=\Large\bfseries, text=white}`)

This style is applied to text drawn on fretted or open string nodes, with the colour switched to black for the latter. It aims to make the text as clear and as big as possible without increasing the node size, which will occur if the text is too tall or wide.

⁴Tantau, *The TikZ and PGF Packages*.

⁵This is because text is put in nodes, which are scaled independently of the picture and require the `scale` and/or `transform shape` options to be supplied.

The rest of the styles define the three symbol shapes used for the fretted (●), open (○) and muted (×) string positions.

`/tikz/string/base` (style, initially {circle, draw, inner sep=0, minimum size=20, transform shape})

Common options for all three symbols. The `transform shape` option is required to correctly scale the symbols, which are implemented as TikZ nodes, with the rest of the picture.

`/tikz/string/fretted` (style, initially {string/base, fill})

`/tikz/string/open` (style, initially {string/base, above})

`/tikz/string/muted` (style, initially {string/open, cross out, minimum size=19})

3.2 Other keys

The following keys are not passed directly to TikZ commands, but used to store various other settings and code. They are all in the `/chordbox` path and should be set using the `\pgfkeys` command, for example `\pgfkeys{/chordbox/name/.code=\writechord{#1}}`. Keys that execute code, like this example, produce output with occurrences of `#1` replaced by the relevant value. If you want to change more than one of these settings at once, it is shorter to issue a command like the following: `\pgfkeys{/chordbox/.cd, numfrets=5, fingering text=on node}`.

`/chordbox/numfrets=<number>` (initially 4)

The number of frets drawn in each chord box.

`/chordbox/base fret` (initially {fr\raisebox{.5ex}{\scriptsize#1})

This key stores the code used to typeset the base fret position of a chord box, if provided and greater than 1.

`/chordbox/name` (initially \ensuremath{\mathrm{#1}})

The code that is used to typeset the name of the chord.

The next two keys govern the placement of extra information in the chord box. In both cases, the `fingering` text is only displayed if actually present in the input.

`/chordbox/text below=none|fingering|pitch` (initially fingering)

Selects what to display below each string.

`/chordbox/text on node=none|fingering|pitch` (initially none)

Selects what to display inside the string symbols.

The remaining keys determine how pitch information is calculated and displayed. Pitches should be given enclosed in quotation marks and accidentals should be specified as `b` (flat) or `\#` (sharp); these will be replaced by their respective symbols.

`/chordbox/flat symbol=<symbol>` (initially \flat)

`/chordbox/sharp symbol=<symbol>` (initially `\sharp`)

`/chordbox/pitch names=<list of pitches>` (initially `{"A", "A\#", "B", "C", "C\#", "D", "D\#", "E", "F", "F\#", "G", "G\#"}`)

The names of the pitches to be used for display. The list need not start at A, but it must contain twelve sequential semitones.

`/chordbox/tuning=<list of pitches>` (initially `{"E", "A", "D", "G", "B", "E"}`)

The tuning of the instrument for which chord boxes are to be drawn. It is used to determine the pitches of the chord and must consist of elements present in `pitch names`.
